

SYSTEM AND METHOD FOR STREAMING VIDEO
INFORMATION TO A USER DEVICE

5

ABSTRACT OF THE DISCLOSURE

A system and method for streaming video information to a user device includes an event server that provides restricted access to various types of event content information and services related to a particular event. A

- 10 wireless portable user device may provide an access code to the event server at a particular event location through a wireless base station that is coupled to a local area network. A system user may thereby utilize the user device to access the event server for downloading appropriate event content information and related services. The event content information may include
- 15 a direct broadcast of streaming video produced by a video service provider from local video cameras positioned at the particular event. In addition, the event content information may include a plurality of event broadcasts that may be generated by the event server after receiving and storing program information from the local video cameras, the Internet, and various external
- 20 program sources. The system user may also request individual video-on-demand services for downloading specific requested information from the event server.
